

AI Readiness Checklist

Self-assessment guide for mid-sized companies (50-500 employees)

Rate each statement from 0 to 5 (0 = doesn't apply/unknown, 5 = completely true). Add up your score and check what it means.

1. Data

- Your data is digitized and accessible from a single source of truth.
- You know your data quality: duplicates, errors and missing values.
- You have at least 12 months of history for the operation you want to improve.
- Clear rules exist on who can access and modify the data.
- You can export your data without relying on third parties or manual processes.

2. Use cases

- You identify repetitive processes consuming more than 5 hours a week.
- You have metrics for the current cost of those processes (time or money).
- You know the KPI that would improve if AI worked (sales, cost, hours).
- You know what decision you would make with the information AI would deliver.
- Someone with authority can prioritize the chosen use case.

3. Infrastructure and tools

- Your critical systems are in the cloud or on managed servers.
- You know your current IT costs and how much they grow each year.
- You have a data security policy and verified backups.
- Your team can integrate new tools without depending on a single vendor.
- System access credentials exist for external teams (if applicable).

4. Team and governance

- Someone in the company owns technology or data.
- Your team has time allocated for technology improvement projects.
- Compliance rules exist (data protection, industry) that must be applied.
- Leadership understands AI is a business project, not an IT project.
- You're ready to set a budget for the first project.

What your score means

80-100	Ready to start an outcome-based pilot this very week.
50-79	Real ground to build on: the AI Readiness Audit maps what to build first and what's missing.
0-49	Most of the value lies in cleaning data and defining processes before AI.
