

TECHNOLOGY & DIGITAL TRANSFORMATION

Technology for your context. Your reality.

We design and deploy software, data systems, applied AI and infrastructure. We transform processes and train your team to operate what we build.

WHO WE ARE

Technology should solve problems, not create new ones.

Wiqonn is a technology and digital transformation studio. We build software, data systems, applied AI and infrastructure around the way your organization works. Every project starts with a measurable goal and includes the knowledge your team needs to take ownership.

01 / 03

CONTEXT FIRST

Your operation. **Your constraints.**

We start with the users, data, systems and rules that shape the problem. The solution fits the environment where it must work.

02 / 03

EVIDENCE
BEFORE SCALE

Measure, **then decide.**

We agree on a baseline, representative data and acceptance criteria. Each phase produces evidence to proceed, refine or stop.

03 / 03

ADOPTION BUILT
IN

Knowledge stays. **Your team grows.**

Training, documentation and knowledge transfer help your team adopt, operate and improve the system after delivery.

FROM CHALLENGE TO ADOPTION

One team from the real problem to a system you can run.

The technology is only one part of the work. We connect [strategy, software, data, AI and infrastructure](#), validate the result in context, and prepare your team to sustain it.

Step 01

Understand the context

We map the challenge, users, data, systems and constraints. Together we define the outcome and the evidence needed to judge it.

Step 02

Design the route

We set priorities, architecture, metrics and decision gates. AI is used when it adds value, alongside the software and infrastructure it needs.

Step 03

Build and validate

We build the system, integrate it with real workflows and evaluate it against representative data before recommending a larger rollout.

Step 04

Train and transfer

We train the people who will use and operate the solution. Your team receives the agreed documentation, access and knowledge.

WHAT WE BUILD

Four connected practices. One team.

Complex challenges rarely fit one discipline. We combine product engineering, data, applied AI, infrastructure and adoption so every part works together.

CAP / 01

Applied AI

We select, adapt, fine-tune or build models around your domain, data and operating constraints.

- Language, multimodal and computer vision
- Forecasting and decision systems
- Private knowledge, document and agentic systems

CAP / 02

Data, Evaluation & MLOps

We build the data and evaluation layer that turns a promising model into a dependable production system.

- Data pipelines, datasets and baselines
- Domain evaluations and production monitoring
- Serving and inference optimization

CAP / 03

Software, Cloud & Infrastructure

We build the applications, APIs and infrastructure that turn technical capability into a usable product or workflow.

- Web, mobile and platform products
- APIs, backends and connected workflows
- Cloud, on-premise, edge and IoT

CAP / 04

Transformation & Adoption

We align processes, technology and teams around a practical roadmap, then build the capability your organization needs to sustain it.

- Roadmaps, process redesign and automation
- Training, documentation and adoption
- Digital marketing, SEO and content when relevant

WHO WE WORK WITH

Built for your context, not a sector template.

We work across sectors and adapt each engagement to the organization's scale, users, data, operating rules and public responsibilities.

PUBLIC & SOCIAL

Institutions and mission-driven organizations

Digital services, internal operations, data and evidence adapted to public responsibility and social impact.

BUSINESS

Organizations of every size

Focused solutions for small teams and connected systems for large or regulated operations.

KNOWLEDGE

Universities and research centers

Academic operations, institutional data, specialized models and infrastructure for applied research.

OPERATIONS

Industry and complex environments

Computer vision, forecasting, edge systems and operational tools designed for real-world constraints.

CONTROL FROM THE START

Trust and ownership, built into delivery.

DATA OWNERSHIP

Your data stays yours

Client data is not reused for other clients or unrelated model training. Access and retention are agreed before work begins.

DEPLOYMENT OPTIONS

Cloud, on-premise or edge

We choose the environment around operational, privacy, latency and integration requirements.

SECURITY & TRACEABILITY

Expectations agreed in writing

Access, security, evaluations, limitations and decision criteria remain documented throughout delivery.

TRAINING & ADOPTION

Build the system. Build the capability.

Training can be part of any Wiqonn engagement. We adapt it to the technology, the people involved and the level of autonomy your organization needs.

MODE 01

Learn by role

Focused sessions for leaders, users and technical teams, based on the decisions and tasks each group owns.

MODE 02

Practice in context

Workshops use the organization's workflows, data and tools so learning connects directly to daily work.

MODE 03

Keep the knowledge

Documentation, playbooks and knowledge transfer help your team operate, improve and teach others.

AVAILABLE ACROSS OUR PRACTICES

TECHNOLOGY SYSTEMS

Applied AI, data, software and infrastructure

From practical use to operation, evaluation, governance and maintenance.

TRANSFORMATION

Processes, automation and adoption

Teams learn how the redesigned workflow works and how to improve it.

GROWTH WHEN RELEVANT

Marketing, SEO, content and analytics

Practical training tied to the channels, audience and measurement system in use.

NEXT STEP

Tell us what needs to change. We'll map the next step.

Bring us the process, product or decision holding your organization back. We will examine the context and tell you plainly where software, data, AI or infrastructure can help.
